Add, delete and modify in the admin panel

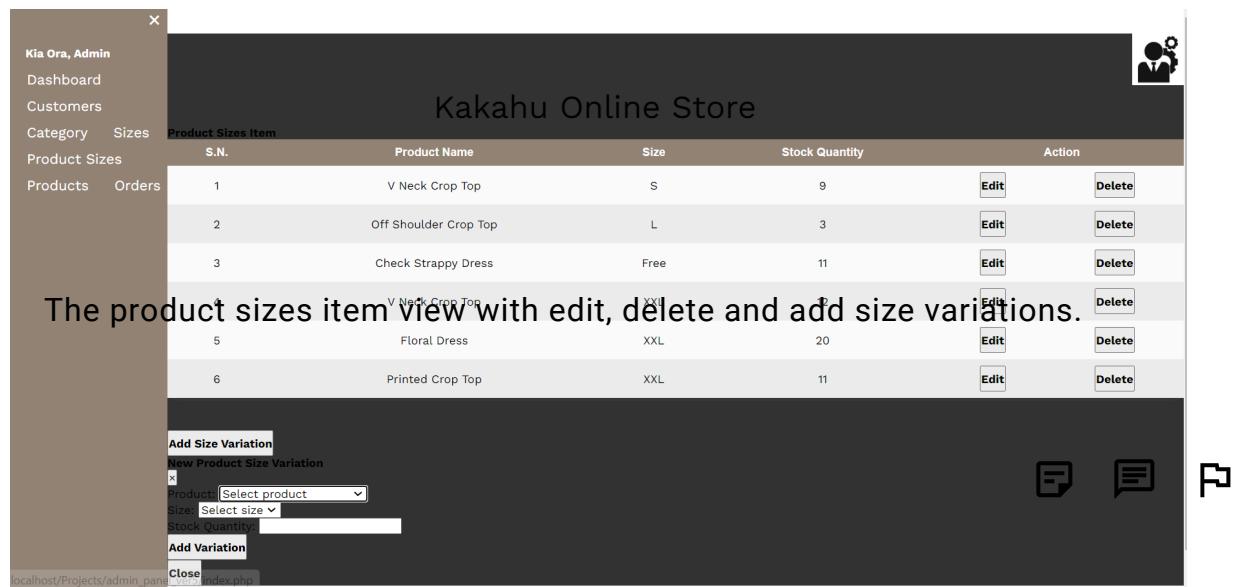

30m

As an authorised user, an administrator can add, delete and modify items in the admin panel. In the following examples, we'll look at the menu item **Product Sizes** and see how you can add, delete and modify size variations.

The image below shows the admin view of Product Sizes. As you saw, the admin panel allows authorised users to edit, delete and add size variations by clicking on the appropriate button. This will update the Product Sizes Items.

Adding a size variation

To add a size variation to the product sizes, you'd select the Add Size Variation button. But what about the PHP code required to add this size variation to the online store? To add a size variation, you must have PHP code that allows the user to select the product, size and quantity available for each added product. The PHP code below will allow the user to do just this.

Here is the code for adding size variation: viewProductSizes.php.

This code is responsible for fetching the array of rows from the table **product_size_variation**. This table is where the data for the Product Size Items are stored and retrieved.

Any changes made to Product Sizes in the admin panel must be reflected in the database. As a result, it is critical that we ensure that once a product size and variation are added, the added item is correctly added to the database. In this case, the additional size variation should be added to the database table **product_size_variation**.

This code shows how to add to the product_size_variation table: addVariationController.php.

Edit a size variation

Along with being able to add a size variation, authorised users are also able to modify or edit the product name, product size or quantity available for a product. On the admin panel, users can select the edit button and then make their changes.

Here is the PHP code for editing a size variation: editVariationForm.php.

This code is responsible for modifying the product name, size and quantity of stock.

Once the **Update Variation** button is clicked, the control will be passed to updateVariationController.php, where modified data will be updated on the product_size_variation table.

The PHP code below shows the update into the product_size_variation table.

Copy

```

1  <?php
2      include_once "../config/dbconnect.php";
3
4      $v_id=$_POST['v_id'];
5      $product= $_POST['product'];
6      $size= $_POST['size'];
7      $qty= $_POST['qty'];
8
9      $updateItem = mysqli_query($conn,"UPDATE product_size_variation SET
10         product_id=$product,
11         size_id=$size,
12         quantity_in_stock=$qty
13         WHERE variation_id=$v_id");
14
15     if($updateItem)
16     {
17         echo "true";
18     }
19  ?>

```

Delete a size variation

Authorised users are also able to delete a selected Product Size Item from the admin panel and database by using the delete button on the admin panel. The selected record will also be deleted from the database and updated accordingly.

When the user clicks the DELETE button in viewProductsizes.php, the user will be able to delete the selected record using deleteVariationController.php. The button shown below calls a JavaScript handler that uses the PHP code in the deleteVariationController.php to delete the record:

```

<td><button class="btn btn-primary"="variationDelete('<?
=>$row['variation_id']?>')">Delete</button></td>

```

☒ Add, edit and delete product items

Non-Assessed

In this activity, you will use what you've just learnt about writing PHP code to allow an administrator to add, edit and delete items from an admin panel.

For this activity, you will follow the same process, but instead of making these changes on the Product Size Items, you will make these changes on the Product Items. To complete this activity, you must:

- Create the PHP code needed to add a new product. The code for adding a new product must allow the user to select a product category and enter a product name, product price and a brief description of the product.
- Create the PHP code needed to edit a product item. This may be in the form of modifying the product name, product category, price or description.
- Create the PHP code needed to delete a product item.

All PHP code created to perform add, edit and delete functions on the admin panel must also make those changes to the database.
