Additional flexbox layout options 60m

Margins

We can manipulate the children as well as the `<ol>` elements by using margin.

- `margin-left: auto` – can format an element to the left
- `margin-right: auto` – can format an element to the right.

Read the article, ***How Auto Margins Work in Flexbox*** (Coyier, 2020) [fnref:a18037](#) for examples of using `margin-left` and `margin-right`. This article shows CodePen examples of each.

Optional activity

Have a go at formatting the code within Example 6.14 Flexbox so:

- that the 1 and 3 cells are formatted to the left and right (margins)
- that the 2 cell is bigger than the other two cells (flex-grow).

Flex-grow

Another useful feature is flex-grow. With this, we can say how much each child grows relative to its neighbours. Each defaults to 1 (takes up an equal fraction of space).

If we imagine creating an online magazine, then we could have the main content section with a flex-grow of 3 (flex-grow:3;) and the sidebar that lists the newest articles with a flex-grow of 1 (flex-grow:1;).

Read ***Flex-grow*** (Coyier, 2021)^{fnref:7eeec8} for some examples of using flex-grow. This article shows CodePen examples of how to use this feature.

Dig deeper

If you want to explore the options available in flexbox more, consider reading this resource:

- Flexbox provides a list of flex values that can be used to create web layouts.

☒ Using flexbox: Task 1
