A good admin panel is measured by how easy it is for an administrator to complete a task and how much time they have to spend on the admin panel. A good admin panel should allow administrators to manage their web applications as easily as possible in as little time as possible; a user does not want to waste time constantly updating or managing things in the admin panel.

Key points to consider when creating an admin panel are:

- designing a simple and clean user interface
- ensuring easy navigation
- providing explanations and instructions for complex tasks.

Simple and clean user interface

A simple and well-structured user interface is the most important design aspect of an admin panel.

When designing an admin panel, aim for simplicity. The goal is to create an admin panel that is functional rather than one that is visually appealing.

- Use simple colours, fonts, effects and graphics because excessive use of these will overwhelm your user and reduce the efficiency of your admin panel.
- Design a simple, intuitive and user-friendly admin panel that anyone can use. Otherwise, you'll have to invest significant time and money into training people on how to use your admin panel.
- Use JavaScript to incorporate buttons into your admin panel. Buttons can be used to enable users to update settings with a single click. If possible, use asynchronous requests so that the page doesn't need to be reloaded when a change is made. Give feedback to users so they know their changes have been saved. Take the time to create these asynchronous functions because they will simplify and improve the usability of your admin panel.

Easy navigation

A user interface needs to be easy to use and intuitive so administrators can complete their tasks as quickly and easily as possible.

Creating an interface with simple navigation allows users to focus on the tasks at hand rather than wasting time navigating a complicated interface.

- Consider whether you require a navigation menu with different nesting levels so that users can easily navigate between the various settings.
- Your user interface should be simple to navigate regardless of the device. Consider responsive design when designing the user interface because it needs to be easy to navigate on all devices.

Explanations and instructions

To assist users in using the admin panel, we recommend including explanations and instructions directly next to complex options. Because admin panels have a lot of different options and functions, having descriptions next to an option is beneficial because it reduces the amount of time a user needs to spend figuring out what to do or searching for documentation to help them.
