Create the menu items and navigation menu

15m

You already have a database connectivity file, but there are two more files you should have:

- a header PHP file used to list menu items
- a sidebar PHP file used to display the navigation menu on the side so the administrators can navigate to various views, like categories, products and sizes.

The PHP code used to create the header file **adminheader.php** that lists the menu items is available in the document below.

To create the menu items for the administrator panel, the PHP code should be placed in the adminheader.php file. This file is responsible for listing the menu items at the top of the admin interface, allowing administrators to easily access key areas of the system.

Download the PHP code used to create the header file adminheader.php.

After you've created the header file, you can then create the sidebar file to display the side toggle items so users can navigate to other toggles and categories within the online store. This PHP code creates the sidebar PHP file: sidebar.php.

For your reference, the CSS style file is available for you in case you want to view or

modify the CSS style sheet.

The owners of Kākahu come to you and request that the admin panel's header and sidebar have their layout and colour variations changed.

☒ Modify header and sidebar

Non-Assessed

For this activity, you will need to modify the PHP code used in the index.php, adminheader.php and sidebar.php files to meet the following client requirements:

- The header should have the hex colour code #011f4b, and the sidebar should have the hex colour code #03396c.
- The font should be readable and accessible to all; a font face like Arial would be ideal.
- A title needs to be added to the header page which reads 'Welcome to Kākahu online store'.

Once you've modified the PHP code to meet the client's new requirements, submit your code in the text box below.

B	<i>I</i>	<u>U</u>		☰	☷	☰	☷	☰		T ²	T ₂		☐
