Manual testing is the process of testing software without the use of tools. Testers are the human tools – requiring a varied skillset and patience – integral to manual testing.

Most applications can be tested manually. Manual testing is often used to test complex applications or services where changes occur often, where it's not sensible to automate certain aspects of the product.

During manual testing, a tester will:

- execute each test case
- compare system behaviour with expected behaviour, applying both positive and negative testing
- identify defects.

Manual testing follows the process of:

- requirement analysis
 - test plan creation
 - test case creation
 - test case execution
-
- defect logging
 - defect tracking and verification.

This is a straightforward process, but it's important that each step is followed carefully and thoroughly to ensure the best outcomes. For example:

- The requirement analysis must involve reading and understanding the software project documentation and studying the AUT.
- The failed test cases must be re-executed after bugs have been fixed to verify that they now pass.

Manual testing can be executed at any of the testing levels from unit testing (although this is usually automated and performed by developers) to integration testing, system testing and acceptance testing.

Test techniques such as black-box and white-box testing and test approaches such as static and dynamic testing can all be used during manual testing.

Ad-hoc testing, where testing is conducted manually using an informal approach, is also classified as manual testing. Often, ad-hoc testing is done to check a particular feature quickly without undergoing the sometimes lengthy formal test processes.

If you need a refresher about this, we recommend taking a look at the following page:

Black-box techniques →

☒ Ad-hoc manual testing

Non-Assessed

Load up the [Resumé page](#) that contains the JavaScript and PHP program code. Perform a couple of tests to see if the contact form works or breaks when various types of data are used.
