

[BIT703 Web Technologies](#) / [Contents](#) / Topic 11: Server-side web application admin panel development / Creating an admin panel

PHP programming 15m

Now let's start the PHP programming to build the interface for the admin panel and its functionality, then connect the admin panel to the database.

We will go over the PHP code needed to:

- configure the database connectivity
- design the admin panel
- create the header to display the menu items
- create the sidebar to display the navigation menu
- allow an authorised user to add, delete and modify items within the admin panel.

Configure the database connection

We'll begin by configuring the database connection, which is an important first step. The PHP code used to configure the database connection should always be included at the beginning of PHP programs that intend to interact with the database. This is to ensure that the database is connected and capable of communicating for data manipulation.

OOP vs procedural programming for the admin panel

For database connection, we learned two approaches, traditional procedural programming and OOP. To match the existing admin panel code that we are using for the examples, the traditional procedural approach has been used. You can refactor the code to OOP approach if this is what you prefer. If you use the OOP approach, then make sure you edit all the code that used dbconnect.php. These

Skip to main content changes will impact the various MySQL calls too.

The code required to configure the database is shown below.

The PHP code used to configure the database connection should be saved in a separate PHP file – dbconnect.php.

☒ Configure database connection

Non-Assessed

Create the configure PHP file so the admin panel is connected and can communicate with the database.
