Responsive testing is a process that renders web pages on viewports of multiple devices using CSS media queries based on the user device where the website is accessed. In simple terms, responsive testing ensures that responsive web design is optimised well for all types of screen sizes and resolutions.

There are a variety of devices used today to access the internet. It has become essential to test website usability and compatibility across different devices. For the best user experience, perform responsive design testing on the following aspects:

- Check all links and URLs on different browsers and devices.
- Check how the websites load on different devices.
- Check the changes in the web content as the screen resolution changes.

Tools for responsive tests

Some of the popular and free tools available to test the responsiveness of your application or website are listed below.

- ResponsiveTestTool
- Am I Responsive?
- BrowserSize

You can even make use of your local web browser to do basic responsive tests, specifically media breakpoint checks and resolution.
