jQuery AJAX methods 10m

As with our earlier introduction to AJAX, the `ajax()` method is used to perform an AJAX (asynchronous HTTP) request. As we discussed earlier, jQuery AJAX uses AJAX methods.

If you need a refresher about this, we recommend taking a look at the following pages:

[JavaScript AJAX](#) →

All jQuery AJAX methods use the `ajax()` method.

The main advantage of AJAX is its ability to improve the performance and usability of web applications. This is done by using AJAX techniques that allow applications to render without data, which reduces the server traffic inside requests. In other words, web pages appear more responsive, since small packets of data are exchanged with the server and web pages are not reloaded each time that a user makes an input change.

AJAX methods are available in the jQuery library, which has a full suite of AJAX capabilities. The functions and methods in it allow you to load data from the server without having to refresh the browser page.

Some of the key jQuery AJAX methods are listed below.

Method	Description
<code>\$.ajax()</code>	Performs an async AJAX request

[Skip to main content](#)

<code>\$.ajaxPrefilter()</code>	Handles custom AJAX options or modifies existing options before each request is sent and before they are processed by: <code>\$.ajax()</code>
<code>\$.ajaxSetup()</code>	Sets the default values for future AJAX requests
<code>\$.ajaxTransport()</code>	Creates an object that handles the actual transmission of AJAX data
<code>\$.get()</code>	Loads data from a server using an AJAX HTTP GET request
<code>\$.getJSON()</code>	Loads JSON-encoded data from a server using an HTTP GET request
URL	Specifies the URL to send the request to

Below is an example of code that illustrates the use of AJAX methods. The code sends the URL request to open a text file on a click event.

Have a look at the code and output below.

<!DOCTYPE html>
<html>
<head>
  <title>jQuery Example</title>
  <script
src="https://ajax.googleapis.com/aj
ax/libs/jquery/3.3.1/jquery.min.js"
></script>
  <script>

    $(document).ready(function() {
      // Styling list items
      with children if needed

      $("li").has("*").css("background-
color", "green");

      // Click event to
      replace text with "Success!" only
      once

      $("button").click(function() {
        // Check and change
        the text content of the h3 element
        if it's not "Success!"
        if
        ($("#h1").text() !== "Success!")
        {
```

The Google AJAX API loader makes it easier to use multiple Google AJAX APIs on the same page and unifies the namespaces across them. Instead of adding a separate script tag for each API, this loader gives you a common way to load multiple APIs at once.
